## DESCRIPTION AND OPERATION

### ENGINE IDENTIFICATION

#### DESCRIPTION

The engine model code and serial number are stamped on the left side of the engine block, just below the oil dipstick tube (Fig. 1). The model code for the 3.1L is 73B followed by a five digit serial number.

![Fig. 1 Engine Code Location](J9509-43)
HYDRAULIC TAPPETS

DESCRIPTION

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending unit. The pressure should be 50 psi at 3000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these 2 conditions could be responsible for noisy tappets:

**OIL LEVEL HIGH**

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

**OIL LEVEL LOW**

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than 1 tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.
## DIAGNOSIS AND TESTING

### SERVICE DIAGNOSIS—DIESEL—PERFORMANCE

<table>
<thead>
<tr>
<th>CONDITION</th>
<th>POSSIBLE CAUSES</th>
<th>CORRECTION</th>
</tr>
</thead>
</table>
| ENGINE WILL NOT CRANK OR CRANKS SLOWLY | 1. Starting motor operating, but not cranking the engine.  
2. Crankshaft rotation restricted.  
3. Starting circuit connections loose or corroded.  
4. Neutral safety switch or starter relay inoperative.  
5. Battery charge low.  
6. No voltage to starter solenoid.  
7. Solenoid or starter motor inoperative. | 1. Remove the starter motor. Check for broken flywheel teeth or a broken starting motor spring.  
2. Rotate the engine to check for rotational resistance.  
3. Clean and tighten connections.  
4. Check starter relay supply voltage and proper operation of neutral safety switch (if equipped). Replace defective parts.  
5. Check battery voltage. Replace battery if a charge cannot be held.  
6. Check voltage to solenoid. If necessary, replace the solenoid.  
7. Replace starter motor. |
| ENGINE CRANKS, BUT WILL NOT START NO SMOKE | 1. No fuel in supply tank.  
2. Electrical fuel shutdown solenoid not operating.  
3. Exhaust plugged.  
5. Excessive fuel inlet restriction.  
6. Injection pump not getting fuel or fuel is aerated.  
7. Worn or inoperative injection pump. | 1. Fill fuel supply.  
2. Check for loose wires and verify that the fuel shutdown solenoid and fuel shutdown solenoid relay is functioning.  
3. Remove the obstruction.  
4. Drain fuel/water separator and replace fuel filter.  
6. Check fuel flow/bleed fuel system.  
7. Visually check delivery with externally connected injector to one of the pump outlets. Repair or replace the pump if fuel is not being delivered. |
| ENGINE HARD TO START, OR WILL NOT START SMOKE FROM EXHAUST | 1. Incorrect starting procedure.  
2. Cranking speed too slow.  
4. One or more cylinder head heater plugs defective.  
5. Insufficient intake air. | 1. The fuel shutoff solenoid control must be in the run position. Ensure proper procedure is being used.  
2. (A) Verify that the transmission is not engaged.  
(B) Check the battery, starting motor and look for loose or corroded wiring connections.  
3. Verify system is working. Repair/replace inoperative parts.  
4. Verify system is working. Repair/replace inoperative parts.  
5. Inspect or replace filter and check for obstruction to the air supply tube. |

</table>
TAPPET NOISE

(1) To determine source of tappet noise, operate engine at idle with cylinder head covers removed.
(2) Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.
(3) Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak down around the unit plunger or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating or by foreign particles becoming wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.

The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. In general, if more than one tappet seems to be noisy, it's probably not the tappets.

SERVICE PROCEDURES

VALVE SERVICE
This procedure is done with the engine cylinder head removed from the block.

DISASSEMBLY
(1) Remove the engine cylinder head from the cylinder block. Refer to cylinder head removal and installation in this section.
(2) Use Valve Spring Compressor Tool and compress each valve spring.
(3) Remove the valve locks, retainers, and springs.
(4) Use an Arkansas smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.
(5) Remove the valves, and place them in a rack in the same order as removed.

VALVE CLEANING
(1) Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.
(2) Clean all grime and gasket material from the engine cylinder head machined gasket surface.

INSPECTION
(1) Inspect for cracks in the combustion chambers and valve ports.
(2) Inspect for cracks on the exhaust seat.
(3) Inspect for cracks in the gasket surface at each coolant passage.
(4) Inspect valves for burned, cracked or warped heads.
(5) Inspect for scuffed or bent valve stems.
(6) Replace scuffed or bent valve stems.
(7) Check valve spring height (Fig. 2).

VALVE REFACING
(1) Use a valve refacing machine to reface the intake and exhaust valves to the specified angle.
(2) After refacing, a margin of at least 4.52-4.49 mm (.178-.177 inch) must remain (Fig. 3). If the margin is less than 4.49 mm (.177 inch), the valve must be replaced.
VALVE SEAT REFACING
(1) Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.
(2) Use tapered stones to obtain the specified seat width when required.

VALVE STAND DOWN
Valve stand down is to maintain the adequate compression ratio.
(1) Invert cylinder head.
(2) Fit each valve to its respective valve guide.
(3) Using a straight edge and feeler gauge (Fig. 4), check valve head stand down: Inlet valve head stand down 1.08 to 1.34 mm (.042 to .052 ins.) and exhaust valve stand down 0.99 to 1.25 mm (.035 to .049 ins.).
(4) If valve head stand down is not in accordance with above, discard original valves, check stand down with new valves and recut valve seat inserts to obtain correct stand down.

VALVE GUIDES
(1) Valve Guides height requirement.
(2) Measurement A (Fig. 5): 13.50 - 14.00 mm.

Fig. 3 Valve Specification

Fig. 4 Checking Valve Stand Down

Fig. 5 Valve Guide Height

VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT
(1) Measure and record internal diameter of valve guides. Valve guide internal diameter is 8.0 to 8.015 mm (.3149 to .3155 ins.).
(2) Measure valve stems and record diameters. Intake valve stem diameter 7.94 to 7.96 mm (.3125 to .3133 in). Exhaust valve stem diameter 7.92 to 7.94 mm (.3118 to .31215 in).
SERVICE PROCEDURES (Continued)

(3) Subtract diameter of valve stem from internal diameter of its respective valve guide to obtain valve stem clearance in valve guide. Clearance of inlet valve stem in valve guide is .040 to .075 mm (.0015 to .0029 in). Clearance of exhaust valve stem in valve guide is .060 to .093 mm (.0023 to .0036 in).

(4) If valve stem clearance in valve guide exceeds tolerances, new valve guides must be installed.

REMOVAL AND INSTALLATION

3.1L TURBO DIESEL ENGINE

REMOVAL

(1) Disconnect the negative battery cable.
(2) Disconnect the engine compartment lamp.
(3) Remove the hood. Refer to Group 23, Body for the procedure.

WARNING: DO NOT LOOSEN THE RADIATOR VENT OR DRAINCOCK WITH THE SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM COOLANT CAN OCCUR.

(4) Open the cooling system vent located on top of the radiator.
(5) Raise the vehicle on the hoist.
(6) Drain the cooling system. Refer to Group 7, Cooling System for the procedure.
(7) Remove the transmission fluid cooler lines from the radiator (Fig. 6).

(8) Remove the lower radiator hose from the radiator (Fig. 6).
(9) Remove the lower fan shroud retaining bolts (Fig. 6).
(10) Remove the exhaust system inlet pipe retaining bolts from the turbocharger (Fig. 7).

WARNING: DO NOT LOOSEN THE RADIATOR VENT OR DRAINCOCK WITH THE SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM COOLANT CAN OCCUR.

(4) Open the cooling system vent located on top of the radiator.
(5) Raise the vehicle on the hoist.
(6) Drain the cooling system. Refer to Group 7, Cooling System for the procedure.
(7) Remove the transmission fluid cooler lines from the radiator (Fig. 6).

(8) Remove the lower radiator hose from the radiator (Fig. 6).
(9) Remove the lower fan shroud retaining bolts (Fig. 6).
(10) Remove the exhaust system inlet pipe retaining bolts from the turbocharger (Fig. 7).

Fig. 7 Exhaust System Inlet Pipe

1 – EXHAUST SYSTEM INLET PIPE RETAINING BOLTS
2 – ENGINE OIL PAN

(11) Remove the nut retaining the wire harnesses on the left engine mount.
(12) Lower the vehicle on the hoist.
(13) Remove the right and left headlamp assemblies from the vehicle. Refer to Group 8L, Lamps for the procedure.
(14) Remove the front fascia. Refer to Group 13, Frame and Bumpers for the procedure.
(15) Disconnect the ambient temperature sensor and unclip the wire harness from the headlamp module mounting assembly.
(16) Disconnect the right and left headlamp module wire harnesses at the 10-way connectors located just above the front bumper to the right and left of the A/C condenser.
(17) Remove the headlamp module mounting (HMM) assembly. Refer to Group 23, Body for the procedure.
(18) Remove the hood latch. Refer to Group 23, Body for the procedure.
(19) Remove the upper fan shroud retaining bolts.
(20) Remove the radiator crossmember from the vehicle.
REMOVAL AND INSTALLATION (Continued)

(21) Remove the manual cooling fan and let set inside of the fan shroud.
(22) Remove the intercooler inlet and outlet hoses from the vehicle (Fig. 8).

(23) Disconnect the breather hose and remove the fresh air inlet tube from the vehicle (Fig. 9).
(24) Remove the radiator overflow hose from the radiator.
(25) Remove the upper radiator hose from the vehicle.
(26) Disconnect the electric radiator cooling fan electrical connector.
(27) Recover the refrigerant. Refer to Group 24, Heating and Air Conditioning for the procedure.
(28) Remove the intake air duct from the vehicle (Fig. 10).
(29) Remove the power steering cooler retaining bolts (Fig. 10) and position the cooler aside.
(30) Remove the suction and discharge lines from the condenser assembly (Fig. 10).

Fig. 8 Intercooler Hoses
1 – INTERCOOLER INLET HOSE
2 – COOLANT RECOVERY HOSE
3 – REFRIGERANT LINE SUPPORT BRACKET
4 – INTERCOOLER OUTLET HOSE
5 – FAN SHROUD

(31) Remove the fan shroud and both cooling fans as an assembly from the vehicle.

NOTE: The cooling module assembly includes the radiator, intercooler and A/C condenser.

(32) Remove the cooling module assembly retaining bolts and remove the cooling module from the vehicle.
(33) Remove the coolant reservoir supply hose from the engine.
(34) Remove the coolant recovery hose from the water manifold.
(35) Remove the EGR valve vacuum supply line from the valve (Fig. 11).
(36) Remove the heater core coolant supply lines from the engine assembly (Fig. 11).
(37) Remove the refrigerant line from the A/C accumulator assembly.
(38) Disconnect the oil pressure and boost pressure sensor electrical connectors and undclip wire harness from the coolant supply lines.
(39) Disconnect the engine ground. Located just behind the oil filter.

(40) Remove the refrigerant line retaining nut from the bulkhead and remove the refrigerant liquid line from the vehicle.

(41) Cut the tiestraps retaining the wire harness to the refrigerant line. Located above the compressor assembly.

(42) Remove the refrigerant line support bracket bolt from the cylinder head cover.

(43) Remove both of the refrigerant line retaining bolts from the compressor and remove the lines from the vehicle.

(44) Remove the power steering fluid supply hose from the pump (Fig. 12).

(45) Remove the power steering fluid pressure line from the pump (Fig. 12).

(46) Remove the vacuum supply hose from the engine mounted steel vacuum source line.

(47) Disconnect the generator field wire connector from the rear of the generator.

(48) Undip the battery feed wire cover and remove the wire from the top of the generator.
(49) Disconnect the speed control servo vacuum supply hose from the engine mounted steel vacuum source line.

(50) Disconnect the fuel supply and return hoses from the engine assembly.

(51) Remove the wire harness mounting bracket retaining nuts from the left engine mount (Fig. 13).

(52) Disconnect the black and gray 10-way electrical connectors from the engine wire harness.

(53) Disconnect the A/C compressor clutch and glow plug harness electrical connectors.

(54) Remove the transmission dipstick tube support bracket retaining nut from the turbocharger heatshield (Fig. 14).

(55) Raise the vehicle on the hoist.

(56) Disconnect the starter motor electrical.

(57) Remove the starter motor retaining bolts and remove the starter from the vehicle (Fig. 15).

NOTE: Mark the position of the torque convertor in relation to the flexplate through the starter motor access hole. This reference mark will be used to line up the two components for reassemble.
(58) Working through the torque convertor bolt access hole (Fig. 16), Rotate the engine to access and remove the (4) torque convertor to flexplate retaining bolts.

Fig. 16 Torque Convertor Bolt Access Hole
1 – TORQUE CONVERTER BOLT ACCESS HOLE
2 – ENGINE OIL PAN
3 – TOP DEAD CENTER ALIGNMENT TOOL ACCESS HOLE

(59) Disconnect the engine ground. Located to the rear of the left engine mount.
(60) Remove the left engine mount throughbolt nut. Do not remove the bolt at this time.
(61) Support the rear of the transmission assembly with a jack.
(62) Remove the (8) transmission support crossmember retaining bolts (Fig. 17).
(63) Lower the transmission and transfer case assembly enough to gain access to the upper six transmission bellhousing bolts.
(64) Remove the upper six bellhousing bolts.
(65) Raise the transmission assembly back into position and temporarily install four of the eight transmission crossmember retaining bolts. Install two bolts on each side.
(66) Remove the remaining four bellhousing bolts.
(67) Partially lower the vehicle.
(68) Remove the engine mount sill plate retaining bolts in the left wheel well (Fig. 18).

Fig. 18 Engine Mount Sill Plate Retaining Bolts - Left Wheel Well
1 – ENGINE MOUNT SILL PLATE RETAINING BOLTS
2 – LEFT FRONT TIRE
REMOVAL AND INSTALLATION (Continued)

(69) Remove the engine mount sill plate retaining bolts in the right wheel well (Fig. 19).

(70) Lower the vehicle to the ground.
(71) Support the front of the transmission with a jack.
(72) Remove the left engine mount sill plate retaining bolts (Fig. 20).
(73) Remove the right engine mount sill plate retaining bolts (Fig. 21).
(74) Set up an engine lifting device and support the weight of the engine assembly.

CAUTION: Before proceeding be certain the front of the transmission is properly supported with a jack.

CAUTION: This engine is equipped with a engine speed sensor located in the top of the bellhousing. Care must be taken not to damage the sensor or corresponding wires during engine removal and installation.

(75) Using the engine lifting device, pull the engine assembly away from the transmission approximately three inches and stop.
(76) Working between the bulkhead and the right rear of the engine assembly, disconnect the engine speed sensor electrical connector.
(77) Remove the left engine mount throughbolt and remove the sill plate.
(78) With assistance from another person, carefully remove the engine assembly from the vehicle.

Fig. 19 Engine Mount Sill Plate Retaining Bolts - Right Wheel Well

One person operating the engine lifting device and the other facilitating the engine removal.
REMOVAL AND INSTALLATION (Continued)

INSTALLATION

CAUTION: This engine is equipped with a misfire sensor. Located in the top of the bellhousing. Care must be taken not to damage the sensor or corresponding wires during engine removal and installation.

CAUTION: Be certain the torque convertor is properly installed in the transmission. If the torque convertor is not installed all the way in the transmission the engine will not rotate upon installation.

(1) With assistance from another person, carefully install the engine assembly in the vehicle. One person operating the engine lifting device and the other facilitating the engine installation.
(2) Install the left engine mount sill plate and throughbolt. Leave loose at this time.
(3) Working between the bulkhead and the right rear of the engine assembly, connect the engine speed sensor electrical connector.
(4) Using the engine lifting device and/or the jack under the transmission, position the engine/transmission assembly so the engine block mounted dowel pins are perfectly aligned with the corresponding holes in the transmission bellhousing.

CAUTION: The engine block and transmission must be in perfect alignment before attempting to install the bellhousing bolts. Misalignment will cause the aluminum bellhousing to be damaged.

(5) Install two engine to transmission bellhousing retaining bolts. One on each side of the bellhousing.
(6) Make certain the engine mount sill plate bolt holes are aligned with the corresponding weld nuts in the frame rails.
(7) Remove the engine lifting device.
(8) Remove the jack from the transmission.
(9) Install the leftside engine mount sill plate retaining bolts (Fig. 22). Leave bolts loose at this time.
(10) Install the rightside engine mount sill plate retaining bolts (Fig. 23). Leave bolts loose at this time.
(11) Partially raise the vehicle on the hoist.
(12) Install the engine mount sill plate retaining bolts in the right wheel well (Fig. 24). Leave bolts loose at this time.
(13) Install the engine mount sill plate retaining bolts in the left wheel well (Fig. 25). Torque the bolts to 61 N·m (45 ft. lbs.).
(14) Torque all engine mount sill plate bolts to 61 N·m (45 ft. lbs.).
(15) Torque the left engine mount throughbolt to 61 N·m (45 ft. lbs.).
(16) Raise the vehicle on the hoist.
(17) Install the remaining lower bellhousing bolts. Torque all the bolts to 102 N·m (75 ft. lbs.).

(18) Support the rear of the transmission with a jack.

(19) Remove the (4) temporarily installed transmission crossmember bolts.

(20) Lower the transmission and transfer case assembly enough to gain access to the upper six bellhousing bolts.

NOTE: Be certain all brackets that were originally installed on the bellhousing bolts are reinstalled. Cable misrouting could result.

(21) Install the upper six bellhousing bolts. Torque the bolts to 102 N·m (75 ft. lbs.).

(22) Raise the transmission assembly back into position and install the eight transmission crossmember retaining bolts (Fig. 26). Torque the bolts to 41 N·m (30 ft. lbs.).

NOTE: When installing the torque converter to flexplate retaining bolts, the torque converter can be rotated into position with a flat-bladed screwdriver through the starter motor access hole. Then working through the torque converter bolt access hole, thread a longer than original bolt into the converter and pull the converter up against the flexplate by hand. Remove the longer bolt and install the original bolts one by one until all bolts are installed. Then go back and torque all bolts to specification.
REMOVAL AND INSTALLATION (Continued)

(23) Rotate the engine assembly to access and install the (4) torque convertor to flexplate retaining bolts. Torque the bolts to 75 N·m (55 ft. lbs.).

(24) Install the wire harness support bracket on the left engine mount.

(25) Install the exhaust system inlet pipe on the turbocharger (Fig. 27). Torque the bolts to 41 N·m (30 ft. lbs.).

(26) Lower the vehicle on the hoist.

(27) Install the transmission dipstick tube support bracket retaining nut on the turbocharger heatshield (Fig. 28). Torque the nut to 25 N·m (221 in. lbs.).

(28) Connect the A/C compressor clutch and glow plug harness electrical connectors.

(29) Connect the black and gray 10-way electrical connectors and clip connectors on the wire harness mounting bracket.

(30) Install the wire harness mounting bracket and retaining nuts on the left engine mount (Fig. 29). Torque the nuts to 25 N·m (221 in. lbs.).

(31) Connect the fuel supply and return hoses on the engine assembly.

(32) Connect the speed control servo vacuum supply hose on the engine mounted steel vacuum source line.

(33) Install the battery feed wire on the top of the generator and install the cover.

(34) Connect the generator field wire connector on the rear of the generator.

(35) Install the vacuum supply hose on the engine mounted steel vacuum source line.
(36) Install the power steering fluid pressure line on the pump (Fig. 30). Be certain the sealing 0-ring is well lubricated and free of tears.

(37) Install the power steering fluid supply hose on the pump (Fig. 30).

(38) Install both of the refrigerant lines on the A/C compressor. Torque the retaining bolts to 28 N·m (21 ft. lbs.). Be certain the sealing gaskets are well lubricated and free of tears.

(39) Install the refrigerant line support bracket and bolt on the cylinder head cover.

(40) Install the tiestraps retaining the wire harness on the low side refrigerant line.

(41) Install the refrigerant liquid line. Torque the retaining nut on the bulkhead to 28 N·m (21 ft. lbs.). Be certain the sealing gasket is well lubricated and free of tears.

(42) Connect the engine ground. Located just behind the oil filter.

(43) Connect the oil pressure and boost pressure sensor electrical connectors and clip the wire harness on the coolant supply tubes.

(44) Install the low side refrigerant line on the A/C accumulator assembly. Torque the nut to 28 N·m (21 ft. lbs.). Be certain the sealing gasket is well lubricated and free of tears.

(45) Install the heater core coolant supply hoses on the engine (Fig. 31).

(46) Install the EGR valve vacuum supply line on the valve (Fig. 31).

(47) Install the coolant recovery hose on the water manifold.

(48) Install the coolant reservoir supply hose on the engine.

(49) Install the cooling module assembly and retaining bolts (Fig. 32). Torque the bolts to 41 N·m (30 ft. lbs.).

(50) Install the fan shroud and both cooling fans as an assembly on the vehicle.

(51) Install the suction and discharge refrigerant lines on the condenser assembly (Fig. 32). Torque the retaining nuts to 28 N·m (21 ft. lbs.). Be certain the sealing gaskets are well lubricated and free of tears.

(52) Position the power steering cooler and install the retaining bolts (Fig. 32).

(53) Charge the refrigerant system. Refer to Group 24, Heating and Air Conditioning for the procedure.

(54) Connect the electric radiator cooling fan electrical connector.

(55) Install the intake air duct on the vehicle (Fig. 32).

(56) Install the upper radiator hose on the vehicle.

(57) Install the radiator overflow hose on the radiator.
(58) Connect the breather hose and install the fresh air inlet tube on the engine (Fig. 33).

(59) Install the intercooler inlet and outlet hoses on the engine (Fig. 34).

(60) Install the manual cooling fan on the engine.

(61) Install the radiator crossmember on the vehicle. Refer to Group 23, Body for the procedure.

(62) Install the upper fan shroud retaining bolts. Torque the bolts to 15 N·m (132 in. lbs.).

(63) Install the hood latch support brackets and the hood latch on the vehicle.

(64) Install the headlamp module mounting (HMM) assembly. Refer to Group 23, Body for the procedure.

(65) Connect the right and left headlamp module wire harnesses at the 10-way connectors. Located just above the front bumper to the right and left of the a/c condenser.

(66) Connect the ambient temperature sensor and clip the wire harness on the headlamp module mounting assembly.

(67) Install the front fascia. Refer to Group 13, Frame and Bumpers for the procedure.
REMOVAL AND INSTALLATION (Continued)

(68) Install the right and left headlamp assemblies on the vehicle. Refer to Group 8L, Lamps for the procedure.
(69) Raise the vehicle on the hoist.
(70) Connect the engine ground. Located to the rear of the left engine mount.
(71) Install the starter motor. Torque the retaining bolts to 24 N·m (212 in. lbs.).
(72) Connect the starter motor electrical. Torque the B+ nut to 8 N·m.
(73) Install the lower fan shroud retaining bolts (Fig. 35). Torque the bolts to 15 N·m (132 in. lbs.).
(74) Install the lower radiator hose on the radiator (Fig. 35).
(75) Install the transmission fluid cooler lines on the radiator (Fig. 35).
(76) Lower the vehicle on the hoist.
(77) Fill the cooling system and close the system vent. Refer to Group 7, Cooling System for the procedure.
(78) Install the hood. Refer to Group 23, Body for procedure.
(79) Fill the power steering system fluid. Refer to Group 19, Steering – Power Steering Pump-Initial operation for the procedure.
(80) Fill the transmission fluid. Refer to Group 21, Transmission and Transfer Case for the procedure.
(81) Connect the negative battery cable.
(82) Check the engine oil level before engine start up.

EXHAUST AND INTAKE MANIFOLD

REMOVAL

NOTE: Both the intake and exhaust manifolds must be removed due to a single sealing gasket for both manifolds.

(1) Disconnect the negative battery cable.
(2) Raise the vehicle on a hoist.

WARNING: DO NOT LOOSEN THE RADIATOR VENT OR DRAINCOCK WITH THE SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM COOLANT CAN OCCUR.

(3) Drain the cooling system. Refer to Group 7, Cooling System for procedure.
(4) Remove the exhaust system inlet pipe retaining bolts (Fig. 36).
(5) Disconnect the turbocharger oil return hose from the turbocharger.
(6) Lower the vehicle on the hoist.
(7) Remove the intercooler inlet hose from the vehicle (Fig. 37).
(8) Disconnect the breather hose from the fresh air inlet tube (Fig. 37).
(9) Undip the air filter cover and remove the fresh air inlet tube from the turbocharger (Fig. 37). Remove the assembly from the vehicle.
(10) Remove the EGR vacuum supply hose from the EGR valve (Fig. 38).
(11) Disconnect the heater core coolant supply lines from the engine assembly (Fig. 38).
(12) Undip the wire harness from the coolant supply lines (Fig. 38).
(13) Remove the (2) EGR valve / coolant supply line retaining bolts (Fig. 38).
(14) Remove the coolant supply line support bracket bolt from the water pump housing.
(15) Disconnect the two remaining hoses and remove the coolant lines from the vehicle.
(16) Remove the oil separator retaining bolts.
(17) Disconnect the crankcase vapor supply and return hoses and remove the oil separator from the vehicle.
(18) Remove the transmission dipstick tube support bracket nut from the turbocharger heatshield (Fig. 39).
(19) Remove the exhaust manifold / turbocharger heatshield retaining bolts and remove the heatshield from the vehicle.
(20) Pull back the EGR tube heatshield to access and remove the EGR tube nut from the exhaust manifold. Remove the EGR valve and tube assembly from the vehicle.
(21) Remove the oil pressure supply line banjo bolt from the turbocharger.
(22) Position a drain pan under the transmission.

(23) Remove the transmission dipstick tube from the transmission oil pan by pulling straight up. Position the tube assembly out of the way to allow for manifold / turbocharger removal.

(24) Remove the exhaust manifold retaining nuts and remove the manifold and turbocharger assembly from the vehicle (Fig. 41).

NOTE: If only servicing the intake manifold the following two steps are not required.

(25) Place the assembly in a vice.

(26) Remove the (4) turbocharger to exhaust manifold retaining nuts and separate.

(27) Remove the (4) intake air duct retaining bolts from the intake manifold.

(28) Remove the remaining bolts from the intake air duct and position the duct and hose assembly out of the way.

(29) Remove the intake manifold retaining bolts and remove the intake manifold from the vehicle (Fig. 41).

(30) Remove the intake/exhaust manifold gasket from the manifolds mounting studs.

CLEANING

All old gaskets should be inspected for any tears or signs of prior leakage. If any gaskets show such indications, they should be replaced with new gaskets. All gasket mating surfaces must be cleaned of old gasket material to produce a smooth and dirt/oil free sealing surface for the new gasket.
REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Position the new intake/exhaust manifold gasket on the manifolds mounting studs.

(2) Install the intake manifold and install the retaining nuts (Fig. 41). Torque the nuts to 32 N·m (23 ft. lbs.).

(3) Position the new intake air duct gasket.

(4) Install the intake air duct on the engine. Torque the bolts to 32 N·m (23 ft. lbs.).

NOTE: If only servicing the intake manifold the following two steps are not required.

(5) Position the gasket and install the turbo on the exhaust manifold. Torque the nuts to 32 N·m (23 ft. lbs.).

(6) Remove the assembly from the vice and position on the exhaust manifold mounting studs.

(7) Install the exhaust manifold retaining nuts and torque to 32 N·m (23 ft. lbs.) (Fig. 41).

(8) Install the transmission dipstick tube in the transmission case.

(9) Remove the drain pan.

(10) Install the oil pressure supply line on turbocharger. Torque the banjo bolt fitting to 27 N·m (20 ft. lbs.). Be certain the copper sealing washers are installed. One on the top and bottom of the supply line.

(11) Install the EGR tube nut on the exhaust manifold and temporarily install one of the EGR valve retaining bolts. Be certain the EGR valve gasket is in place.

(12) Torque the EGR tube retaining nut to 34 N·m (25 ft.lbs.). Remove the temporarily installed EGR valve bolt.

(13) Install the exhaust manifold heatshield (Fig. 40). Torque bolts to 11 N·m (97 in. lbs.).

(14) Install the transmission dipstick tube support bracket retaining nut on the turbocharger heat shield (Fig. 42). Torque the nut to 20 N·m (177 in. lbs.).

(15) Install the front (front of engine) heater core coolant supply hoses on the coolant line assembly and install the line assembly on the engine. Torque the (3) retaining bolts to 27 N·m (20 ft. lbs.) (Fig. 43).

(16) Connect the crankcase vapor supply and return hoses on the oil separator.

(17) Install the oil separator retaining bolts.

(18) Install the heater core coolant supply hoses on the coolant line assembly (Fig. 43).

(19) Clip the wire harness on the coolant supply lines (Fig. 43).

(20) Install the EGR vacuum supply hose on the EGR valve.
REMOVAL AND INSTALLATION (Continued)

(21) Install the fresh air inlet tube assembly on the turbocharger. Clip the air filter cover in position and connect the breather hose (Fig. 44).

(22) Install the intercooler inlet hose on the vehicle (Fig. 44).
(23) Raise the vehicle on the hoist.
(24) Install the turbocharger oil return hose on the turbocharger.
(25) Install the exhaust system inlet pipe on the turbocharger (Fig. 45). Torque the bolts to 22 N·m (194 in. lbs.).
(26) Lower the vehicle on the hoist.
(27) Fill the cooling system. Refer to Group 7, Cooling System for procedure.
(28) Check the transmission fluid level and top off if necessary.
(29) Connect the negative battery cable.
(30) Start the engine and check for leaks.

CYLINDER HEAD COVER

REMOVAL
(1) Disconnect the negative battery cable.
(2) Recover the refrigerant system. Refer to Group 24, Heating and Air Conditioning for the procedure.
(3) Raise the vehicle on the hoist.
(4) Remove the front splash shield.
(5) Remove the low pressure refrigerant line retaining bolt and remove the line from the compressor. Cover both openings.
(6) Remove the left engine mount throughbolt nut. Do not remove the bolt at this time.
(7) Lower the vehicle on the hoist.
(8) Remove the intake manifold elbow inlet hose (Fig. 46).
(9) Remove the intake manifold elbow (Fig. 46).
(10) Remove the refrigerant line support bracket retaining bolt from the cylinder head cover and position the refrigerant line out of the way.
(11) Disconnect the (5) glow plug electrical connectors and position the wire harness out of the way.
(12) Remove the Crankcase breather hose from the front of the cylinder head cover.
(13) Remove the cylinder head cover retaining bolts (Fig. 47) (Fig. 48).
(14) Remove the fuel filter / water separator retaining nuts and position the filter assembly out of the way.
(15) Position a jack under the oil pan. Make sure to place a piece of wood between the jack and the oil pan.
(16) Slightly, raise the weight off of the left engine mount until the left engine mount throughbolt can be removed.
(17) Using the jack, lower the engine assembly until the cylinder head cover can be removed from the vehicle.
REMOVAL AND INSTALLATION (Continued)

![Fig. 46 Intake Manifold Elbow](image1)

**Fig. 46 Intake Manifold Elbow**

1 – INTAKE MANIFOLD ELBOW
2 – INTERCOOLER OUTLET HOSE
3 – GENERATOR
4 – UPPER RADIATOR HOSE

**INSTALLATION**

(1) Install the cylinder head cover and gasket. Torque the bolts to 15 N·m (133 in. lbs.) (Fig. 47) (Fig. 48).

(2) Using the jack, raise the engine assembly until the left engine mount throughbolt can be installed.

(3) Remove the jack and install the fuel filter / water separator.

(4) Connect the crankcase breather hose to front of cylinder head cover.

(5) Connect the (5) glow plug electrical connectors (Fig. 47).

(6) Position the refrigerant line and install the retaining bolt.

(7) Install the intake manifold elbow (Fig. 46).

(8) Install the intake manifold elbow inlet hose (Fig. 46).

(9) Raise the vehicle on the hoist.

(10) Install the left engine mount throughbolt nut. Torque the nut to 61 N·m (45 ft. lbs.).

(11) Install the low pressure refrigerant line and retaining bolt. Torque the bolt to 28 N·m (21 ft. lbs.). Be certain the sealing o-ring is well lubricated and free of tears.

(12) Install the front splash shield.

(13) Lower the vehicle on the hoist.

(14) Connect the negative battery cable.

(15) Evacuate and charge the refrigerant system. Refer to Group 24, Heater and Air Conditioning for procedure.

(16) Start the engine and check for leaks.

**WARNING:** USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

**HYDRAULIC TAPPETS**

**REMOVAL**

(1) Disconnect the negative battery cable.

(2) Discharge the air conditioning system. Refer to Group 24, Heating and Air Conditioning for procedure.

(3) Remove the A/C lines at the compressor and cap.

(4) Remove the A/C line bracket attached to the cylinder head cover and move the lines away from the cylinder head.
(5) Remove cylinder head cover. Refer to cylinder head cover removal and installation procedure in this section.

(6) Remove the rocker assemblies and push rods. Refer to rocker arms and push rod removal and installation procedure in this section. Identify push rods to ensure installation in original location.

(7) Remove cylinder head, intake manifold, and exhaust manifold. Refer to cylinder head removal and installation in this section.

(8) Remove the tappet retainers (Fig. 50).

(9) Slide Hydraulic Tappet Remover/Installer Tool through opening in block and seat tool firmly in the head of tappet.

(10) Pull the tappet out of the bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

CAUTION: The plunger and tappet bodies are not interchangeable. The plunger and valve must always be fitted to the original body. It is advisable to work on one tappet at a time to avoid mixing of parts. Mixed parts are not compatible. DO NOT disassemble a tappet on a dirty work bench.
REMOVAL AND INSTALLATION (Continued)

INSTALLATION

1. Lubricate the tappets.
2. Install the tappets and retainers in their original positions. Ensure that the oil feed hole in the side of the tappet body faces up (away from the crankshaft).
3. Install the cylinder head, intake manifold, and exhaust manifold. Refer to cylinder head removal and installation in this section.
4. Install the push rods.
5. Install the rocker arms. Refer to rocker arms and push rod removal and installation in this section.
6. Install the cylinder head cover. Refer to cylinder head cover removal and installation in this section.
7. Connect the negative battery cable.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

8. Start and operate engine. Warm up to normal operating temperature.

ROCKER ARMS AND PUSH RODS

REMOVAL

1. Disconnect the negative battery cable.
2. Discharge the air conditioning system. Refer to Group 24, Heating and Air Conditioning for procedure.
3. Remove the service valves and cap the compressor ports. Refer to Group 24, Heating and Air Conditioning.
4. Remove the cylinder head cover. Refer to cylinder head removal and installation in this section.
5. Remove the rocker arm retaining nut (Fig. 51) (Fig. 52).
6. Remove the rocker assembly. Place them on a bench in the same order as removed.
7. Remove the push rods and place them on a bench in the same order as removed.

INSTALLATION

1. Rotate the crankshaft until the mark lines up with the TDC mark on the timing cover.
2. Install the push rods in the same order as removed.

WARNING: During the installation of the rocker arm assemblies it is possible to cause valve interference between the piston and valve if the piston is near Top Dead Center (TDC). This is due to the slow bleed down rate of the tappets when adjusting the rocker arm assemblies. Follow the procedure below to ensure that engine damage does not occur.

- Install the rocker arm assemblies in the same order as removed.
- Bring piston #1 to Top Dead Center.
- At this point tighten the rocker arm nuts for cylinder #2–3–4–5. Torque nuts to 27 N·m (20 ft. lbs.).
- Slowly rotate the crankshaft 90° clockwise or counterclockwise, then tighten the rocker arm nuts for cylinder #1. Torque nuts to 27 N·m (20 ft. lbs.).
4. Install the cylinder head cover. Refer to cylinder head cover removal and installation in this group.
5. Evacuate and charge the air conditioning system. Refer to Group 24, Heater and Air Conditioning.
6. Connect the negative battery cable.

VALVE SPRINGS

This procedure can be done with the engine cylinder head installed on the block. Each valve spring is held in place by a retainer and a set of conical valve locks. The locks can be removed only by compressing the valve spring.

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the cylinder head cover. Refer to cylinder head cover removal and installation in this section.
REMOVAL AND INSTALLATION (Continued)

(3) Remove the rocker arm assemblies and push rods. Refer to rocker arm and push rod removal and installation in this section. Retain the push rods, and rocker arm assemblies in the same order and position as removed.

(4) Inspect the springs and retainer for cracks and possible signs of weakening.

(5) Install an air hose adaptor in the fuel injector hole.

(6) Connect an air hose to the adapter and apply air pressure slowly. Maintain at least 621 kPa (90 psi) of air pressure in the cylinder to hold the valves against their seats.

(7) Tap the retainer or tip with a rawhide hammer to loosen the lock from the retainer. Use Valve Spring Compressor Tool to compress the spring and remove the locks.

(8) Remove the valve spring and retainer.

(9) Inspect the valve stems, especially the grooves. An Arkansas smooth stone should be used to remove nicks and high spots.

INSTALLATION

(1) Install the valve spring and retainer.

(2) Compress the valve spring with Valve Spring Compressor Tool and insert the valve locks. Release the spring tension and remove the tool. Tap the spring from side-to-side to ensure that the spring is seated properly on the engine cylinder head.

(3) Disconnect the air hose. Remove the adaptor from the fuel injector hole and install the fuel injector.

(4) Repeat the procedures for each remaining valve spring to be removed.

(5) Install the push rods. Ensure the bottom end of each rod is centered in the plunger cap seat of the hydraulic valve tappet.

WARNING: During the installation of the rocker arm assemblies it is possible to cause valve interference between the piston and valve if the piston is near Top Dead Center (TDC). This is due to the slow bleed down rate of the tappets when adjusting the rocker arm assemblies. Follow the procedure below to ensure that engine damage does not occur.

- Install the rocker arm assemblies in the same order as removed.
- Bring piston #1 to Top Dead Center.
- At this point tighten the rocker arm nuts for cylinder #2-3-4-5. Torque nuts to 27 N·m (20 ft. lbs.).
- Slowly rotate the crankshaft 90° clockwise or counterclockwise, then tighten the rocker arm nuts for cylinder #1. Torque nuts to 27 N·m (20 ft. lbs.).
- Install the cylinder head cover. Refer to cylinder head cover removal and installation in this section.
- Connect the negative battery cable.
ENGINE CYLINDER HEAD

REMOVAL

(1) Disconnect the negative battery cable.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAIN COCK WITH THE SYSTEM HOT AND PRESSURIZED BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

(2) Drain the cooling system. Refer to Group 7, Cooling System for procedure.

(3) Discharge the air conditioning system. Refer to Group 24, Heating and Air Conditioning for procedure.

(4) Remove the A/C lines at the compressor and cap. Refer to Group 24, Heating and Air Conditioning.

(5) Remove A/C line bracket attached to cylinder head cover, and move A/C lines away from cylinder head.

(6) Remove the intake manifold elbow air inlet hose (Fig. 53).

(7) Remove the intake manifold elbow (Fig. 53).

(8) Remove the air cleaner hose from turbocharger and breather hose.

(9) Remove the upper radiator hose and coolant recovery hose.

(10) Remove the water manifold (Fig. 54).

(11) Disconnect the heater hoses (Fig. 55).
REMOVAL AND INSTALLATION (Continued)

(12) Remove the EGR valve/heater core supply line retaining bolts
(13) Remove the heater core supply lines
(14) Remove the exhaust manifold/turbocharger heat shield (Fig. 56).

(15) Disconnect the oil feed line from turbocharger.

(16) Disconnect the oil return line from turbocharger (Fig. 57).

(17) Raise vehicle on hoist.
(18) Disconnect the exhaust pipe at the turbocharger.
(19) Remove the Exhaust manifold and turbocharger. Refer to Group 11, Exhaust System and Turbocharger.
(20) Disconnect the boost pressure sensor electrical connector.
(21) Remove the Intake manifold. Refer to intake manifold removal and installation procedure in this section.
(22) Remove the oil feed line retaining clip at rear of the cylinder head (Fig. 58).

(23) Remove the oil feed line for rocker arm assemblies (Fig. 59).

(24) Remove the Crankcase breather hose from front of the valve cover.

(25) Remove the injector sensor wire and the glow plug hot lead.

(26) Remove the fuel injector supply lines from injectors.

(27) Remove the fuel injectors with tool VM.1012B (Fig. 60). Refer to Group 14, Fuel System for procedure.

(28) Remove the cylinder head cover. Refer to cylinder head cover removal and installation procedure in this section.
(29) Remove the rocker retaining nuts (Fig. 62) (Fig. 63).

(30) Remove the rocker arm assemblies. Place them on a bench in the same order as removed.

(31) Remove the push rods and place them on a bench in the same order as removed.

(32) Mark the cylinder head positions.

(33) Remove the engine cylinder head bolts with special tool VM.1018 and VM.1019.

(34) Remove the engine cylinder head and gasket.

(35) Stuff clean lint free shop towels into the cylinder bores.

**CYLINDER HEAD GASKETS**

A one piece steel cylinder head gasket is used for all five cylinder heads.

Cylinder head gaskets are available in three thicknesses. Identification holes or notches in the right front corner of the gasket indicate the thickness of the gasket (Fig. 64).

**CAUTION:** Piston protrusion must be measured, to determine cylinder head gasket thickness, if one or more cylinder wall liners have been replaced.
REMOVAL AND INSTALLATION (Continued)

NOTE: If cylinder wall liners have not been removed; the same thickness head gasket removed, may be used.

MEASURING PISTON PROTRUSION

(1) Use special tool VM.1010 with dial indicator special tool VM.1013 (Fig. 65).

(2) Bring the piston of cylinder no. 1 exactly to top dead center.

(3) Zero the dial indicator on the cylinder block mating surface.

(4) Setup the dial indicator on the piston crown (above the center of the piston pin) 5mm (1/8 in.) from the edge of the piston and note the measurement (Fig. 66).

(5) Repeat the procedure with the rest of the cylinders.

(6) Establish the thickness of the steel gasket for all four cylinder heads on the basis of the greatest piston protrusion (Fig. 64).

CAUTION: The cylinder head gasket is to be installed DRY. DO NOT use a gasket sealing compound on the gasket.

INSTALLATION

(1) Remove the shop towels from the cylinder bores. Coat the bores with clean engine oil.

(2) Install cylinder head alignment studs VM.1009.

(3) After determining the correct head gasket thickness, clean the block and head mating surfaces, place the engine cylinder head gasket over the alignment studs.

(4) Place the engine cylinder head over the alignment studs.

CAUTION: New cylinder head bolts must be used.

(5) Tighten the engine cylinder head bolts in sequence according to the following procedure (Fig. 67):

a. The threads and underside heads of the bolts should be lubricated. Use the cylinder head alignment studs tool number VM-1009. Position the heads on the block and secure with the twelve large center bolts and spacers (clamps), finger tight only.

b. Ensure that the various clamps are installed correctly and the head gasket remains in it's proper position, completely covered. Then, lubricate and install the ten small bolts, also finger tight.

(6) Install the intake and exhaust manifolds with a new gasket, partially tightening the nuts to a maximum of 5 N·m (44 in. lbs.). This will align the heads.
REMOVAL AND INSTALLATION (Continued)

Refer to Group 11, Exhaust System and Turbocharger for the proper procedure.

(7) Then, tighten the 14mm bolts with special tool VM.1019 in the following manner:

(8) **1st Phase:** Tightening Head Bolts (Fig. 67). Central bolts (A-L): Tighten all bolts, starting with bolt I then J-K-L-A-B-C-D-E-F-G-H, to 30 N·m. Tighten all bolts an additional 70°, starting with bolt A and continuing in alphabetical order. Finally, tighten all bolts an additional 70°, starting again with bolt A and continuing in alphabetical order.

(9) Tighten the 12mm bolts in the following manner:

(10) Side bolts (M1-M2): Tighten M1 bolts to 30 N·m, then rotate them 85° (±5). Tighten M2 bolts to 30 N·m, then rotate them 85° (±5).

**NOTE:** If vehicle is equipped with A/C do not install A/C lines to compressor and charge A/C till Phase 2 is complete.

(11) **2nd Phase:** After 20 minutes of engine operation at operating temperature, allow engine to cool down completely. Then retorque the head bolts as follows:

(12) Central bolts A-L: Completely back off bolts one-by-one and then retighten to 30 N·m plus 130° (±5°). Then proceed in the same way, bolt by bolt, following alphabetical order, as indicated.

(13) Side bolts M1-M2: **Without slackening,** torque bolts M1 then bolts M2 to 90 N·m (66 ft. lbs.).

(14) Torque intake nuts to 28 N·m (20 ft. lbs.) and exhaust manifolds nuts to 32 N·m (24 ft. lbs.) after completing the cylinder head torquing procedure.

(15) Install the oil feed lines for the rocker arm assemblies. Torque oil feed lines to 13 N·m (115 in. lbs.) (Fig. 68).

WARNING: During the installation of the rocker arm assemblies it is possible to cause valve interference between the piston and valve if the piston is near Top Dead Center (TDC). This is due to the slow bleed down rate of the tappets when adjusting the rocker arm assemblies. Follow the procedure below to ensure that engine damage does not occur.

- Install the rocker arm assemblies in the same order as removed (Fig. 70).
- Bring piston #1 to Top Dead Center.
- At this point tighten the rocker arm nuts for cylinder #2–3–4–5. Torque nuts to 27 N·m (20 ft. lbs.).
- Slowly rotate the crankshaft 90° clockwise or counterclockwise, then tighten the rocker arm nuts for cylinder #1. Torque nuts to 27 N·m (20 ft. lbs.).
- Install the cylinder head cover. Torque bolts to 15 N·m (133 in. lbs.) (Fig. 71).
- Connect the crankcase breather hose to front of cylinder head cover.
- Connect the injector sensor wire and the glow plug hot lead.
- Install the turbocharger oil feed line. Torque banjo bolts to 27 N·m (20 ft. lbs.).
- Install the turbocharger oil return line. Torque bolts to 11 N·m (97 in. lbs.).
- Install the water manifold. Torque bolts to 12 N·m (106 in. lbs.).
- Raise the vehicle on hoist.
- Install the exhaust pipe to turbocharger. Torque bolts to 32 N·m (23 ft. lbs.).
- Lower vehicle form hoist.
- Install the exhaust manifold/turbocharger heat shield. Torque bolts to 11 N·m (8 ft. lbs.).
- Install the heater core supply lines.
- Install the EGR valve/heater core supply line retaining bolts. Torque bolts to 28 N·m (20 ft. lbs.).
- Install the intercooler hose to turbocharger.
- Install the air cleaner hose to turbocharger.
- Install the oil breather hose to air cleaner hose.
- Connect the recover hose to water manifold.
- Install the fuel injectors using special tool VM.1012B. Refer to Group 14, Fuel System for procedures.
- Install the fuel supply lines to injectors. Torque nuts to 19 N·m (14 ft. lbs.).
- Connect the A/C lines to compressor and install bracket on cylinder head cover.
- Connect the upper radiator hose.
- Install the intake manifold elbow and intercooler hose.
REMOVAL AND INSTALLATION (Continued)

(40) Connect the negative cable battery.

(41) Evacuate and charge the air conditioning system. Refer to Group 24, Heater and Air Conditioning.

(42) Fill the cooling system. Check for leaks.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(43) Operate the engine with the radiator cap off. Inspect for leaks and continue operating the engine until the thermostat opens. Add coolant, if required.

NOTE: The one piece steel type head gasket does not require retorquing.

VIBRATION DAMPER

REMOVAL

(1) Disconnect the negative battery cable.

(2) Remove the fan and set fan inside fan shroud then remove fan shroud and fan as an assembly.

(3) Remove the accessory drive belt. Refer to Group 7, Cooling System for procedure.

(4) Remove the vibration damper nut.

(5) Install special tool VM.1000-A to remove vibration damper (Fig. 72).

INSTALLATION

(1) Install the vibration damper and align with key way.

(2) Install the vibration damper nut. Torque nut to 196 N·m (147 ft. lbs.).

(3) Install the accessory drive belt. Refer to Group 7, Cooling System for procedure.

(4) Connect the negative battery cable.

TIMING GEAR COVER OIL SEAL

REMOVAL

(1) Disconnect the negative battery cable.

(2) Remove the vibration damper. Refer to vibration damper removal and installation procedure in this section.

CAUTION: Use care when removing the old seal. Be sure not to damage the timing gear cover.

(3) Pry out the old seal.
REMOVAL AND INSTALLATION (Continued)

INSTALLATION
The seating diameter must be 68.000 - 68.030 mm.

(1) Install the new seal using special tool VM.1015A (Fig. 74).

(2) Install the vibration damper. Refer to vibration damper removal and installation procedure in this section.

(3) Connect the negative battery cable.

TIMING GEAR COVER

REMOVAL
(1) Disconnect the negative battery cable.
(2) Remove the fan and set fan inside fan shroud then remove fan shroud and fan as an assembly.
(3) Remove the accessory drive belt. Refer to Group 7, Cooling System for procedure.
(4) Remove the vibration damper nut.
(5) Install special tool VM.1000-A to remove the vibration damper (Fig. 75).
(6) Remove the fan pulley (Fig. 76).

NOTE: The idler pulleys have left hand threaded bolts.
(7) Remove the idler pulley and bracket (Fig. 76).
(8) Remove the automatic belt tensioner (Fig. 76).
(9) Remove the Power steering pump pulley (Fig. 76).
(10) Remove the timing gear cover.
INSTALLATION

(1) Be sure the mating surfaces of the gear case cover and the cylinder block are clean and free from burrs.

(2) Apply a continuous 3 mm bead of Silicone Sealer (Fig. 77) to timing cover, install within 10 minutes, tighten 6mm bolts to 11 N·m (8 ft. lbs.) and tighten 8mm bolts to 26.2 N·m (19 ft. lbs.).

(3) Install Power steering pump pulley. Torque bolts to 25 N·m (18 ft. lbs.).

(4) Install the automatic belt tensioner.

(5) Install the idler pulleys. Torque nut to 47 N·m (34 ft. lbs.).

NOTE: The idler pulley has left hand thread.

(6) Install the idler pulleys. Torque nut to 47 N·m (34 ft. lbs.).

(7) Install the fan pulley. Torque bolts to 28 N·m (21 ft. lbs.).

(8) Install the vibration damper. Torque nut to 196 N·m (147 ft. lbs.).

(9) Install the accessory drive belt. Refer to Group 7, Cooling System for procedure.

(10) Install the fan and fan shroud.

(11) Connect the negative battery cable.

CAMSHAFT

REMOVAL

(1) Disconnect the negative battery cable.

(2) Remove the cylinder head cover. Refer to cylinder head cover removal and installation in this section.

(3) Remove the cylinder heads. Refer to cylinder head removal and installation in this section.

(4) Remove the rocker arm assemblies, push rods, and hydraulic tappets. Refer to the respective groups in this section.

(5) Remove the fan and set fan inside fan shroud then remove fan shroud and fan as an assembly.
(6) Remove the accessory drive belt. Refer to Group 7, Cooling System for procedure.

(7) Remove the radiator, A/C condensor, and intercooler as an assembly. Refer to Group 7, Cooling System for procedure.

(8) Remove the vibration damper. Refer to vibration damper removal and installation in this section.

(9) Remove the power steering pump pulley.

(10) Remove timing gear cover. Refer to timing gear cover removal and installation in this section.

(11) Rotate the engine to align the timing marks as shown (Fig. 78).

NOTE: The oil dipstick tube must be removed for camshaft removal.

(12) Unscrew the flange bolts and remove camshaft (Fig. 79).

THRUST PLATE INSPECTION

Check the thickness (Fig. 80) of the plate at points a-b-c-d. If the measurement is not between 3.950 - 4.050 it must be changed.

INSTALLATION

(1) Coat the camshaft journals with clean engine oil and carefully install the camshaft complete with thrust plate and gear. Tighten retaining bolts to 18 N·m (13 ft. lbs.). Be sure to align the timing marks as shown (Fig. 81).

(2) Install the hydraulic tappets and retainers. Refer to hydraulic tappet removal and installation in this section.

(3) Install the cylinder heads. Refer to cylinder head removal and installation in this section.

(4) Install the push rods and rocker arm assemblies. Refer to the respective sections.
(5) Install the cylinder head cover. Refer to cylinder head cover removal and installation in this section.

(6) Install the timing gear cover. Refer to timing gear cover removal and installation in this section.

(7) Install the vibration damper. Refer to the vibration damper removal and installation in this section.

(8) Install the radiator, A/C condenser, and intercooler. Refer to Group 7, Cooling System for procedure.

(9) Install the fan and fan shroud. Torque fan to 56 N·m (41 ft. lbs.).

(10) Evacuate and charge the air conditioning system. Refer to Group 24, Heater and Air Conditioning for procedure.

(11) Connect the negative battery cable.

(12) Fill the cooling system. Check for leaks.

**WARNING:** USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(13) Operate the engine with the radiator cap off. Inspect for leaks and continue operating the engine until the thermostat opens. Add coolant, if required.

**CAMSHAFT BEARINGS**

This procedure requires that the engine is removed from the vehicle.

**REMOVAL**

(1) With the engine completely disassembled, install the Camshaft Bearing Remover/Installer Tool VM.1040 (Fig. 82).

(2) Pull the camshaft bearings out of the cylinder block.
REMOVAL AND INSTALLATION (Continued)

INSTALLATION

CAUTION: Be sure the oil holes in the center bearings are lined up with oil gallery holes in the cylinder block.

1. Install the front and rear camshaft bearings with Camshaft Bearing Remover/Installer Tool VM.1040.
2. Install the remaining bearings in the same manner. The bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearings. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly.

OIL PAN

REMOVAL

1. Disconnect the negative battery cable.
2. Raise the vehicle on hoist.
3. Drain the oil.
4. Remove the oil pan lower cover.
5. Remove the bolts from oil pan. Remove the 6 bolts that are on the inside of the oil pan.
6. Remove the oil pan.

INSTALLATION

1. Remove all gasket material from cylinder block. Be careful not gouge or scratch aluminum pan sealing surface.
2. Apply a continuous 3-mm bead of Silicone Sealer to oil pan, install within 10 minutes. Install the oil pan.
3. Install the oil pan bolts. Torque bolts to 13 N·m (9 ft. lbs.).
4. Install the oil pan lower cover. Torque bolts to 13 N·m (9 ft. lbs.).
5. Install the oil drain plug. Torque to 79 N·m (58 ft. lbs.).
6. Lower the vehicle from hoist.
7. Fill engine with proper amount of oil.
8. Connect the negative battery cable.

OIL PUMP

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the timing gear cover. Refer to timing gear cover removal and installation in this section.
3. Remove the oil pump (Fig. 83).

INSTALLATION

1. Install new O-ring and lubricate with clean engine oil.
2. Install the oil pump. Torque screws to 28 N·m (20 ft. lbs.). Check for normal backlash between pump and crankshaft gears.
3. Install the timing gear cover. Refer to timing gear cover removal and installation in this section.
4. Connect the negative battery cable.

INTERNAL VACUUM PUMP

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the timing gear cover. Refer to timing gear cover removal and installation in this section.
3. Align all the timing marks before removing the vacuum pump (Fig. 84).
4. Remove the vacuum pump retaining bolts.
5. Remove the internal vacuum pump.

INSTALLATION

1. To install the vacuum pump, align the outer part of the gear with the inner part using a screwdriver or similar tool, align with timing marks on gear set and install (Fig. 84). Torque bolts to 28 N·m (20 ft. lbs.).
2. Install the timing gear cover. Refer to timing gear cover removal and installation in this section.
3. Connect the negative battery cable.
OIL PUMP PRESSURE RELIEF VALVE

REMOVAL

(1) Disconnect the negative battery cable
(2) Remove the oil pan. Refer to oil pan removal and installation procedure in this section.
REMOVAL AND INSTALLATION (Continued)

3. Remove the relief valve snap ring.
4. Remove the relief valve cap, spring, and plunger (Fig. 88).
5. Check the relief valve spring length. Relief valve spring free length is 57.5mm (2.263 in.). If spring length is less or spring is distorted it must be replaced.
6. Check the plunger for scoring, replace if necessary.

INSTALLATION

1. Thoroughly clean all components and relief valve pocket in cylinder block.
2. Fit plunger, spring and cap into block.
3. Compress spring and install the snap ring. Ensure the snap ring is completely seated in groove.
4. Install the oil pan. Refer to oil pan removal and installation procedure in this section.
5. Connect the negative battery cable.

OIL FILTER ADAPTER AND OIL COOLER

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the oil cooler coolant hoses.
3. Remove the oil filter housing/oil cooler retaining bolt (Fig. 89).
4. Remove the oil filter housing and oil cooler (Fig. 90).

![Fig. 88 Oil Pressure Relief Valve](image1)

![Fig. 89 Oil Filter Housing](image2)

![Fig. 90 Oil Cooler](image3)
REMOVAL AND INSTALLATION (Continued)

INSTALLATION
(1) Install the oil cooler and oil filter housing with a new gasket. Torque bolt to 46.6 N·m (34 ft. lbs.).
(2) Install the oil cooler coolant hoses.
(3) Connect the negative battery cable.

ENGINE OIL FILTER

REMOVAL

(1) Raise the vehicle on a hoist.
(2) Position a drainpan under the oil filter housing (Fig. 92).
(3) Remove the oil filter housing drain plug. Located in the center of the housing cap. Drain the engine oil from the oil filter housing.
(4) Remove the oil filter housing cap by rotating counter-clockwise.
(5) If the element remains in the housing remove the oil filter element by pulling it straight down and out of the oil filter housing.
(6) Remove the oil filter housing sealing o-ring from the housing cap and discard. A new o-ring is supplied with the oil filter element.

(7) Clean the oil filter housing and housing cap with shop solvent.

INSTALLATION
(1) Install a new sealing o-ring in the housing cap and lubricate with fresh engine oil.
(2) Install the new filter element in the housing and install cap (Fig. 92). Torque to 22.5 N·m (194in. lbs.).
(3) Install the oil filter housing drain plug. Torque to 12 N·m (106in. lbs.).
(4) Lower the vehicle on hoist.
(5) Fill the engine oil level to specification.
(6) Start the engine and check for leaks.

PISTONS AND CONNECTING ROD ASSEMBLY

REMOVAL
(1) Disconnect the battery cable.
(2) Remove cylinder heads, refer to cylinder head removal and installation in this section.
(3) Raise vehicle on host.
(4) Remove oil pan, refer to oil pan removal and installation in this section.
(5) Remove top ridge of cylinder bores with a ridge reamer before removing pistons from cylinder block. Be sure to keep tops of pistons covered during this operation. Mark piston with matching cylinder number.
REMOVAL AND INSTALLATION (Continued)

(6) Pistons and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

(7) Remove connecting rod cap bolts and cap. Push each piston and rod assembly out of cylinder bore.

NOTE: Be careful not to nick crankshaft journals.

(8) After removal, install bearing cap on the mating rod.

PISTON PIN—REMOVAL

(1) Secure connecting rod in a soft jawed vice.

(2) Remove 2 clips securing piston pin.

(3) Push piston pin out of piston and connecting rod.

PISTON RING—REMOVAL

(1) ID mark on face of upper and intermediate piston rings must point toward piston crown.

(2) Using a suitable ring expander, remove upper and intermediate piston rings (Fig. 94).

(3) Remove the upper oil ring side rail, lower oil ring side rail and then oil ring expander from piston.

(4) Carefully clean carbon from piston crowns, skirts and ring grooves ensuring the 4 oil holes in the oil control ring groove are clear.

PISTON RING FITTING

(1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 in.) from bottom of cylinder bore. Check gap with feeler gauge. Top compression ring gap .25 to .50 mm (.0098 to .0196 in.). Second compression ring gap .25 to .35 mm (.0098 to .0137 in.). Oil control ring gap .25 to .58 mm (.0098 to .0228 in.).

Fig. 94 Piston Rings—Removing and Installing

Fig. 95 Ring Gap Measurement

1 – FEELER GAUGE
REMOVAL AND INSTALLATION (Continued)

(2) If ring gaps exceed dimension given, new rings or cylinder liners must be fitted. Keep piston rings in piston sets.

(3) Check piston ring to groove clearance (Fig. 96). Top compression ring gap .08 to .130mm (.0031 to .0051 in.). Second compression ring gap .070 to .102mm (.0027 to .0040 in.). Oil control ring gap .040 to .072mm (.0015 to .0028 in.).

PISTON RINGS—INSTALLATION

(1) Install rings on the pistons using a suitable ring expander (Fig. 97).

(2) Top compression ring is tapered and chromium plated. The second ring is of the scraper type and must be installed with scraping edge facing bottom of the piston. The third is an oil control ring. Ring gaps must be positioned, before inserting piston into the liners, as follows (Fig. 99).

(3) Top ring gap must be positioned at 30 degrees to the right of the combustion chamber recess (looking at the piston crown from above).

(4) Second piston ring gap should be positioned on the opposite side of the combustion chamber recess.

(5) Oil control ring gap to be located 30 degrees to the left of combustion chamber recess.

(6) When assembling pistons check that components are installed in the same position as before disassembly, determined by the numbers stamped on the crown of individual pistons. Engine cylinders are numbered starting from gear train end of the engine. Face chamber recess side of piston towards camshaft. Therefore, the numbers stamped on con rod big end should also face in the same direction. To insert piston into cylinder use a ring compressor as shown in (Fig. 100).

PISTON PIN INSTALLATION

(1) Secure connecting rod in soft jawed vice.

(2) Lubricate piston pin and piston with clean oil.

(3) Position piston on connecting rod.

CAUTION: Ensure combustion recess in piston crown and the bearing cap numbers on the connecting rod are on the same side.

(4) Install piston pin.

(5) Install clips in piston to retain piston pin.

(6) Remove connecting rod from vice.
REMOVAL AND INSTALLATION (Continued)

INSTALLATION
(1) Before installing pistons, and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap (Fig. 99).
- The top piston ring gap must be positioned at 30 degrees to the right of the combustion chamber recess (looking at the piston crown from above).
- The second piston ring gap should be positioned on the opposite side of the combustion chamber recess.
- The piston oil control ring gap is to be located 30 degrees too the left of the combustion chamber recess.

(2) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located as shown in (Fig. 99).

(3) Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston and tighten with the special wrench (Fig. 100). Ensure position of rings does not change during this operation.
(4) Face chamber recess side of piston towards camshaft.
(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.
(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.
(7) Install rod caps. Install cleaned and oiled rod bolts. Torque bolts to 29.5 N·m (22 ft. lb.) plus 60°.

CYLINDER WALL LINER ASSEMBLY
REMOVAL
(1) Disconnect the negative battery cable
(2) Remove the engine from vehicle.
(3) With the engine completely disassembled, install the Cylinder Liner Puller Tool VM-1001 to remove liners (Fig. 101) (Fig. 102).
(4) Remove shims from cylinder liner or cylinder block recess. Keep shims with each cylinder liner.
INSTALLATION

1. Carefully clean residual LOCTITE from liner and crankcase, and degrease the crankcase where it comes into contact with the liners. Install the liners in the crankcase as shown (A), rotating them back and forth by 45° in order to guarantee correct positioning (Fig. 104).

2. Measure the liner recess relative to block deck with a dial indicator mounted on a special tool VM-1010 A. **All the measurements must be taken on camshaft side.** Zero dial gauge on block deck.

3. Move dial gauge to cylinder liner record reading on dial gauge.

4. Remove liner and special tool.

5. Then select the correct shim thickness to give proper protrusion (0.01 - 0.06 mm).

6. Fit the shim and the O-rings onto the liner.

7. Lubricate the lower liner location in the block. Apply LOCTITE AVX to the corner of the liner seat. Apply LOCTITE AVX uniformly to the upper part of the liner at area.

8. Fit the liners in the crankcase making sure that the shim is positioned correctly in the seat. Lock the liners in position using special tool (VM-1016) and bolts (Fig. 105). Clean the residual LOCTITE on the upper surface of the block deck.

9. Recheck the liner protrusion. It should be 0.01 - 0.06 mm.

**NOTE:** A period of six hours must elapse between the liners being installed and engine start-up. If engine assembly is not continued after liner installation, the liners need to be clamped for twelve hours minimum.

FLEXPLATE

REMOVAL

**NOTE:** This must be done with the engine or transmission removed from the vehicle.

1. Remove the six flexplate mounting bolts and the flexplate.
INSTALLATION

1. Install the flexplate on the flexplate adapter hub.
2. Install the flexplate mounting bolts.
3. With the flexplate mounting bolts still loose, rotate the flexplate clockwise looking from the back of the engine. This will eliminate any backlash between the flexplate and mounting bolts.
4. Torque the mounting bolts to 44 N·m.

TRANSMISSION PILOT BUSHING

REMOVAL

NOTE: This requires the transmission or the engine to be removed from the vehicle.

1. Install special tool VM-8399 into the transmission pilot bushing (Fig. 106).
2. Tighten special tool VM-8399 to remove the transmission pilot bushing (Fig. 107).
INSTALLATION
(1) Place the transmission pilot bushing into the flexplate adapter hub.

(2) Install special tool VM-8372 on the flexplate adapter hub (Fig. 108).

(3) Tighten the center bolt on special tool VM-8372 to install the transmission pilot bushing.
REMOVAL AND INSTALLATION (Continued)

(4) Once the transmission pilot bushing is installed, remove the special tool VM-8372.
(5) Use special tool VM-8390 to make sure pilot bushing is installed to proper depth (Fig. 109). Be sure that the outside edges of special tool VM-8390 make contact with the flexplate adapter hub. If contact is not made remove the transmission pilot bushing and check for debris in the flexplate adapter hub. Then reinstall the transmission pilot bushing into the flexplate adapter hub.

CRANKSHAFT AND MAIN BEARINGS

REMOVAL

(1) Disconnect the negative battery cable.
(2) Remove the engine from vehicle. Refer to engine removal and installation in this section.
(3) Install the engine on an engine stand.
(4) Remove the accessory drive system.
(5) Remove the cylinder heads. Refer to cylinder head removal and installation in this section.
(6) Remove the oil pan and oil pick-up.
(7) Remove the pistons and connecting rods.
(8) Remove the vibration damper. Refer to vibration damper removal and installation in this section.
(9) Remove the timing gear cover. Refer to timing gear cover removal and installation in this section.
(10) Remove the oil pump and vacuum pump from block.
(11) Install special tool VM.1004 onto crankshaft over gear (Fig. 110).
(12) Remove the main bearing oil feed and crankshaft support locators from block.
(13) Remove the flexplate and adaptor plate from engine block.
(14) Remove the thrust bearings from rear main bearing carrier.
(15) Slide the crankshaft and bearing carriers rearward to rear of cylinder block. Remove crankshaft from the rear of the cylinder block.
REMOVAL AND INSTALLATION (Continued)

(16) Mark the carriers for assembly and remove the bolts, two for each carrier. Separate the two halves of each carrier, remove from the crankshaft and temporarily re-assemble the carriers (Fig. 111).

Fig. 111 Crankshaft and Carrier Bearing Assembly
1 – CRANKSHAFT SUPPORT
2 – CRANKSHAFT MAIN BEARING HALVE
3 – CRANKSHAFT MAIN BEARING HALVE
4 – CRANKSHAFT SUPPORT BOLTS
5 – CRANKSHAFT GEAR
6 – CRANKSHAFT
7 – CRANKSHAFT KEY

(17) Install the Crankshaft Bearing Remover/Installer VM.1002 on the front main bearing (Fig. 112).
(18) Using the VM.1002 pull the front main bearing out of the cylinder block (Fig. 112).

INSTALLATION

NOTE: Be sure that the oil hole in the main bearing lines up with the oil gallery hole in the cylinder block.

(1) Using the VM.1002 push the front main bearing into the cylinder block (Fig. 113).
(2) Fit the main bearing supports together. Torque to 44 N·m (32 ft. lbs.)
(3) Check internal diameter of bearings.

Fig. 112 Crankshaft Front Main Bearing Removal
1 – CYLINDER BLOCK
2 – VM.1002

Fig. 113 Crankshaft Front Main Bearing Installation
1 – FRONT CRANKSHAFT MAIN BEARING
2 – CYLINDER BLOCK
3 – VM.1002

(4) If internal diameter of original bearing is being checked and figures are not within specifications, new bearings must be used.
(5) Check the crankshaft main bearing journals to bearing clearances. Clearances of main bearings is .03 to .088 mm (.0011 to .0035 in.).

NOTE: Assemble engine according to sequence described, thus saving time and preventing damages to engine components. Clean parts with a suitable solvent and dry them with compressed air before assembly. Use new gaskets where applicable and torque wrenches for correct tightening of components.

(6) Thoroughly clean crankcase and oil passages, and blow dry with compressed air.

(7) Install new main bearing shells in each of the carrier halves. Assemble the carriers to the crankshaft journals, ensuring that the carriers are installed in their original locations. Secure each carrier with the two bolts tightening evenly to 44 N·m (32 ft. lbs.).

(8) Slide special tool VM.1004 over the crankshaft gear and, insert the crankshaft and support assembly into the crankcase in the same manner used for removal.

(9) Align the holes in the lower supports, with the center of the crankcase webs (Fig. 114).

(10) Secure each support assembly to the crankcase with the main bearing oil feed and support locators. Torque to 54 N·m (40 ft. lbs).

(11) Install the rear main bearing support onto crankshaft ensuring arrow on bearing support aligns with vertical web in center of crankcase.

(12) Install the rear oil seal.

(13) Install the new O-rings in adaptor plate.

(14) Install the adaptor plate to block. Torque nuts to 28 N·m (20 ft. lbs.).

(15) Install the Allen bolts through adaptor plate to rear main bearing support. Torque to 11 N·m (97 in. lbs.).

(16) Position the flexplate adapter hub and O-ring on crankshaft and align bolt holes.

NOTE: For purposes of checking crankshaft end play, used adapter hub bolts may be used. Final assembly requires new adapter hub bolts.

(17) Install 2 adapter hub bolts, 180° apart, and tighten bolts to 20 N·m plus 60° (15 ft. lbs.) plus 60°.

(18) Attach dial indicator to engine block.

(19) Move crankshaft toward front of engine and zero indicator.

(20) Move crankshaft toward the rear of engine and record measurement.

(21) Subtract specified crankshaft end play from figure obtained. Crankshaft end play 0.08 to 0.28 mm (.0060 to .0119 in.).

(22) Select thrust washers which will give correct end play.

(23) Remove tools and adapter hub.

(24) Lubricate thrust washer halves and fit them into the rear main bearing carrier.

(25) Ensure that crankshaft end and adapter hub mating surfaces are clean and dry. Install O" ring in adapter hub groove.

(26) To verify correct end play, install 2 adapter hub bolts 180° apart, and tighten bolts to 20 N·m plus 60° (15 ft. lbs. plus 60°).

(27) Measure crankshaft end play with a dial gauge. Crankshaft end play should not exceed 0.08 to 0.28 mm (.0060 to .0119 in.) (Fig. 115).

CAUTION: Use NEW adapter hub bolts for the following procedure.

(28) Install a new O-ring on adapter hub. Install adapter hub on crankshaft. The 6 adapter hub bolts must be tightened as follows:

a. Lubricate and install the 6 new adapter hub bolts.

b. Torque the 6 adapter hub bolts to 50 N·m (36 ft. lbs.) starting one bolt and following with the opposite one (cross tightening) until completion, in a clockwise direction..

c. Loosen one bolt at a time and tighten to 20 N·m (14 ft. lbs.) plus 75° using the cross tightening method.

(29) Install the pistons and connecting rod assemblies. Refer to piston and connecting rods removal and installation in this section.
(30) Install the oil pick up tube. Torque bolts to 25 N·m (18 ft. lbs.).
(31) Install the oil pan. Refer to oil pan removal and installation in this section.
(32) Install the vacuum pump, being careful to align the gear timing marks with those on the crankshaft gear. Torque screws to 20 N·m (15 ft. lbs.).
(33) Before installing the oil pump check pump bore depth in block (A) and pump body height (B) (Fig. 116). Difference between A and B should be 0.020-0.082 mm (.0007 to .0032 in.).
(34) Install the oil pump. Torque screws to 27 N·M (20 ft.lbs.). Check for normal backlash between pump and crankshaft gears.
(35) Install the timing gear cover. Refer to timing gear cover removal and installation in this section.
(36) Install the vibration damper. Refer to vibration damper removal and installation in this section.
(37) Install the cylinder heads. Refer to cylinder head removal and installation in this section.

**DISASSEMBLY AND ASSEMBLY**

**HYDRAULIC TAPPETS**

**DISASSEMBLE**

1. Pry out plunger retainer spring clip.
2. Clean varnish deposits from inside of tappet body above plunger cap.
3. Invert tappet body and remove plunger cap, plunger, check valve, check valve spring, check valve retainer and plunger spring. Check valve could be flat or ball.

**ASSEMBLE**

1. Clean all tappet parts in a solvent that will remove all varnish and carbon.
2. Replace tappets that are unfit for further service with new assemblies.
DISASSEMBLY AND ASSEMBLY (Continued)

(3) If plunger shows signs of scoring or wear, install a new tappet assembly. If valve is pitted, or valve seat on end of plunger is prevented from seating, install a new tappet assembly.
(4) Assemble tappets.

CLEANING AND INSPECTION

CYLINDER HEAD

CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and exhaust manifold and engine cylinder head mating surfaces. Remove all gasket material and carbon.
Check to ensure that no coolant or foreign material has fallen into the tappet bore area.
Remove the carbon deposits from the combustion chambers and top of the pistons.

INSPECTION

Use a straightedge and feeler gauge to check the flatness of the engine cylinder head and block mating surfaces (Fig. 117).
Minimum cylinder head thickness 89.95mm (3.541 in.)

CAUTION: If only one cylinder head is found to be distorted and requires machining, it will also be necessary to machine the remaining cylinders heads and end plates by a corresponding amount to maintain correct cylinder alignment.

ROCKER ARMS AND PUSH RODS

CLEANING

Clean all the components (Fig. 118) with cleaning solvent.
Use compressed air to blow out the oil passages in the rocker arms and push rods.

Fig. 117 Checking Cylinder Head Flatness

Fig. 118 Rocker Arm Components
1 – ROCKER ARM
2 – SPRING PLATE
3 – ROCKER SUPPORT
4 – PUSH ROD
5 – HYDRAULIC TAPPET
6 – CAMSHAFT
7 – ANTIROTATION BRACKET

INSPECTION

Inspect the pivot surface area of each rocker arm. Replace any that are scuffed, pitted, cracked or excessively worn.
Inspect the valve stem tip contact surface of each rocker arm and replace any rocker arm that is deeply pitted.
Inspect each push rod end for excessive wear and replace as required. If any push rod is excessively worn because of lack of oil, replace it and inspect the corresponding hydraulic tappet for excessive wear.
Inspect the push rods for straightness by rolling them on a flat surface or by shining a light between the push rod and the flat surface.
A wear pattern along the length of the push rod is not normal. Inspect the engine cylinder head for obstruction if this condition exists.
CLEANING AND INSPECTION (Continued)

PISTONS AND CONNECTING ROD ASSEMBLY

INSPECTION—PISTONS
(1) Piston Diameter: Size: 91.93-91.94mm (3.6191-3.6196 in.) Maximum wear limit.05mm (.0019 in.).
(2) Check piston pin bores in piston for roundness. Make 3 checks at 120° intervals. Maximum out of roundness.05mm (.0019 in.).
(3) The piston diameter should be measured approximately 15 mm (.590 in.) up from the base.
(4) Skirt wear should not exceed 0.1 mm (.00039 in.).
(5) The clearance between the cylinder liner and piston should not exceed 0.25 mm (.0009 in.).
(6) Make sure the weight of the pistons does not differ by more than 5 g.

INSPECTION—CONNECTING ROD
(1) Assemble bearing shells and bearing caps to their respective connecting rods ensuring that the serrations on the cap and reference marks are aligned.
(2) Tighten bearing cap bolts to 29N·m (21 ft. lbs.) plus 60°.
(3) Check and record internal diameter of crank end of connecting rod.

NOTE: When changing connecting rods, all five must have the same weight and be stamped with the same number. Replacement connecting rods will only be supplied in sets of five.

Connecting rods are supplied in sets of five since they all must be of the same weight category. Max allowable weight difference is 18 gr.

NOTE: On one side of the big end of the con rod there is a two-digit number which refers to the weight category. On the other side of the big end there is a four digit number on both the rod and the cap. These numbers must both face the camshaft as well as the recess on the piston crown (Fig. 120). Lightly heat the piston in oven. Insert piston pin in position and secure it with provided snap rings.

The Four digit numbers marked on con rod big end and rod cap must be on the same side as the camshaft (Fig. 120). After having coated threads with Molyguard, tighten con rod bolts to 29 N·m (21 ft. lbs.) plus 60°.

INSPECTION—PISTON PIN
(1) Measure the diameter of piston pin in the center and both ends.
(2) Piston pin diameter is 29.990 to 29.996mm (1.1807 to 1.1809 in.).

INSPECTION—CRANKSHAFT JOURNALS
(1) Using a micrometer, measure and record crankshaft connecting rod journals, take reading of each journal 120° apart. Crankshaft journal diameter is 53.84 to 53.955mm (2.1196 to 2.1242 in.).
(2) Crankshaft journals worn beyond limits or show signs of out of roundness must be reground or replaced. Minimum reground diameter is 53.69mm (2.1137 in.).
CLEANING AND INSPECTION (Continued)

BEARING-TO-JOURNAL CLEARANCE  
Compare internal diameters of connecting rod with crankshaft journal diameter. Maximum clearance between connecting rod and crankshaft journals 0.022 to 0.076 mm (0.0008 to 0.0029 in.).

CYLINDER WALL LINER ASSEMBLY

INSPECTION  
The cylinder walls should be checked for out-of-round and taper with dial bore gauge. The cylinder bore out-of-round is 0.100 mm (0.0039 inch) maximum and cylinder bore taper is 0.100 mm (0.0039 inch) maximum. If the cylinder walls are badly scuffed or scored, new liners should be installed and honed, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B (Fig. 122). Top measurement should be 10 mm (3/8 inch) down and bottom measurement should be 10 mm (3/8 inch.) up from bottom of bore.

Fig. 121 Bearing Clearance

Fig. 122 Liner Inspection

OIL PUMP

CLEANING  
Wash all parts in a suitable solvent and inspect carefully for damage or wear.

INSPECTION  
(1) Before installing oil pump check pump bore depth in block (A) and pump body height (B) (Fig. 123). Difference between A and B should be 0.020-0.082 mm.

Fig. 123 Oil Pump Bore Depth

Fig. 124 Oil Pump Inner and Outer Rotors
1 – OUTER ROTOR  
2 – INNER ROTOR
CLEANING AND INSPECTION (Continued)

(2) Check clearance between rotors (Fig. 125).

Rear bearing diameter
Nominal .......................... 80.045-80.070 mm
-0.25 ..................... 79.795-79.820 mm
-0.125 .................... 79.920-79.945 mm

Clearance between journal and bearing: 0.045-0.090

Wear limit: 0.200 mm

Connecting rod journal
Nominal .......................... 53.940-53.955 mm
-0.25 ..................... 53.690-53.705 mm
-0.125 .................... 53.814-53.830 mm

Connecting rod bearing
Nominal .......................... 53.977-54.016 mm
-0.25 ..................... 53.727-53.766 mm
-0.125 .................... 53.852-53.891 mm

Clearance between journal and bearing: 0.022-0.076

Wear limit: 0.200 mm

Connecting rod end play
End play ......................... 0.080-0.280 mm
Adjustment ........................ Thrust washers
Thrust washers available: ........... 2.31-2.36 mm
2.41-2.46 mm
2.51-2.56 mm

Main bearing carriers

Internal diameter
Front ......................... 67.025-67.050 mm
Center ......................... 66.670-66.687 mm
Rear ......................... 85.985-86.005 mm

Liners

Internal diameter .................. 91.997-92.015 mm
Protrusion ........................ 0.01-0.06 mm
Adjustment ........................ Shims
Available Shims: ................... 0.15 mm
0.17 mm
0.20 mm
0.23 mm
0.25 mm

Cylinder head

Minimum thickness .................. 89.95-90.05 mm
Gaskets thickness: .............. 1.41 mm +/-0.08, 0 notches
.................................. 1.61 mm +/-0.08, 1 notches
.................................. 1.51 mm +/-0.08, 2 notches
End plates:
Height ......................... 89.92-90.00 mm

Fig. 125 Checking Rotor Clearance
